The blood-brain barrier (BBB) is a diffusion barrier essential for the normal function of the central nervous system. The BBB endothelial cells differ from endothelial cells in the rest of the body by the absence of fenestrations, more extensive tight junctions (TJs), and sparse pinocytotic vesicular transport.

The Clotting Cascades. The clotting cascades: The intrinsic cascade (which has less in vivo significance in normal physiological circumstances than the extrinsic cascade) is initiated when contact is made between blood and exposed negatively charged surfaces. The extrinsic pathway is initiated upon vascular injury which leads to exposure of tissue factor, TF (also identified as factor III), a ...

Results. We found 'round cell' to be distinct from known cells in sediment and is close to proximal convoluted tubule-derived cells based on morphology and molecular marker expression (GGT1 but not podocalyxin). Also it was positive for undifferentiated cell markers, including PAX2, WT1, OSR1, and SIX2. They were observed in end-stage renal failure patients and the number of cells was ...

Hematopoietic stem cells (HSCs) are the stem cells that give rise to other blood cells. This process is called haematopoiesis. This process occurs in the red bone marrow, in the core of most bones. In embryonic development, the red bone marrow is derived from the layer of the embryo called the mesoderm. Hematopoiesis is the process by which all mature blood cells are produced.
